ABSTRACT

This document examines the geographical mobility of population in the United States from 1975 to 1977. It is divided into three main parts. The first part briefly traces the interregional migration of blacks, the black return migration to their region of birth, the interregional migration of whites, and the metropolitan and nonmetropolitan migration of blacks and whites. The second part contains 43 detailed tables. The tables are divided into five subject areas: detailed mobility, general mobility, mobility for standard metropolitan statistical areas (SMSA's), mobility for central cities of SMSA's, and regional mobility. These five areas are further subdivided by social, economic, and general characteristics such as age, race, Spanish origin, years of school completed, marital status, household relationship, families, employment status, occupation, income, receipt of public assistance, and above or below poverty level. The third part, the appendix, includes related reports, allocations of mobility status, definitions, and the source and reliability of estimates. Also included are tables on the standard errors of estimated numbers and percentages, factors to be applied to generalized errors, and parameters for estimated numbers and percentages. Most of the estimates in this report are based on data collected by the Current Population Survey. (Author/JK)

Geographical Mobility: March 1975 to March 1977

INTERREGIONAL MIGRATION OF BLACKS

According to estimates from the March 1977 Current Population Survey (CPS), the Northeast region had net outmigration of Blacks from March 1975 to March 1977. The survey asked respondents where they lived in March 1975, and the data indicated that during this 2-year period, 43,000 Blacks 2 years old and over moved to the Northeast and 147,000 moved from the region, giving it a net outmigration of 104,000 Blacks 2 years old and over.

From 1960 to 1970 and in most decades since the Civil War the Northeast had net immigration of Blacks; thus, the change to net outmigration since 1970 represents an alteration of a long-standing pattern of migration among Blacks.¹ This change in the Northeast's pattern of net migration of Blacks comes about as a result of both fewer Blacks moving to the region and more Blacks leaving the region.²

Like the Northeast, the North Central region has experienced changes in Black migration patterns in recent years. In the period from March 1975 to March 1977, as in 1970 to 1975, the number of Blacks moving to the North Central region was not significantly different from the number of Blacks moving from the region. This approximate equality in the number of Blacks moving to and from the region represents a substantial change since the 1960's, when the region had a large net immigration of Blacks.³

The South has also undergone alteration in net migration of Blacks since 1970. From March 1975 to March 1977 the number of Blacks moving from the South was not significantly different from the number moving to that region. The same basic pattern has characterized other migration intervals since 1970, but the approximate equality between Black migrants to and from the South represents a change from the 1960's, when the region had net outmigration of Blacks.⁴

It is perhaps necessary to emphasize that CPS data since 1970 do not allow one to conclude that the South has net

immigration of Blacks, at least according to the rules of statistical inference employed by the Census Bureau. Although the South is no longer experiencing the large volume of net outmigration of Blacks as it did in the 1960's, the survey data cannot demonstrate that the region has net immigration of Blacks, because the number of Blacks migrants to the South from 1970 to 1975 and from 1975 to 1977 was not significantly different from the number of Black migrants from the South. It is, however, analytically important that each successive survey since 1970 has shown the same pattern, suggesting that a larger sample might provide a statistically significant net immigration of Blacks to the South.

From March 1975 to March 1977, the West had net immigration of Blacks, just as it did in the 1960's and from 1970 to 1975. In the 1975 to 1977 period, 97,000 Blacks 2 years old and over moved to the West and 24,000 moved from the West, giving the region a net immigration of 73,000 Blacks 2 years old and over.

BLACK RETURN MIGRATION

Many of the Black migrants from the Northeast and to the South are probably returnees, that is, Blacks born in the South and returning to their region of birth. There are no data on return migration from the March 1977 survey, but return migration figured prominently in Black migration to the South from 1955 to 1960 and from 1965 to 1970. In both of those 5-year intervals Black returnees constituted about two-thirds of Blacks moving to the South.⁵ Whether this trend has continued is a question that will have to be investigated with data from the 1980 census.

A trend that was clear in the 1960's was a rise in the rate at which Southern-born Blacks returned to the South. The Black rate of return migration rose by over 40 percent between 1955 to 1960 and 1965 to 1970. The Black rate of return to the South rose from about 2.7 returnees per 100 former outmigrants from 1955 to 1960 to about 3.9 returnees per 100 former outmigrants from 1965 to 1970. Whether the Black rate of return migration to the South has

¹ U.S. Bureau of the Census, *Historical Statistics of the United States, Colonial Times to 1970, Bicentennial Edition, Part 1*. Washington, D.C.: U.S. Government Printing Office, 1975.

³ U.S. Bureau of the Census, *Historical Statistics of the United States, Colonial Times to 1970, Bicentennial Edition, Part 1*. Washington, D.C.: U.S. Government Printing Office, 1975.

⁴ *Ibid.*

⁵ Larry H. Long and Kristin A. Hansen, "Trends in Return Migration to the South," *Demography* 12 (November 1975) pp. 601-614.

continued to rise since 1970 cannot be directly demonstrated, but if two-thirds of Black migrants to the South since 1970 are returnees, then the Black rate of return migration would have risen to around 6.0 returnees per 100 former outmigrants from 1970 to 1975. Even if it rose to this level it would still be below the White rate of return to the South; from 1965 to 1970 White return migrants to the South numbered about 12.8 per 100 former outmigrants.⁶

In the past an important characteristic of Black return migration to the South was positive selectivity according to level of education. That is, Blacks who had been most likely to move back to the South were those with the highest level of education. Previous research found this pattern to exist from 1955 to 1960 as well as from 1965 to 1970.⁷

An important question for future investigation involves the readiness with which Northern-born Blacks move to the South or other regions to take advantage of expanding employment opportunities. A sizable proportion of the Black population now lives in States and metropolitan areas of the North where employment opportunities and income levels have generally not been rising as rapidly as in parts of the South and West. The degree to which differences in income and employment levels of Blacks and Whites converge may be related to the relative responsiveness of the two population groups to regional differences in income-earning opportunities.

INTERREGIONAL MIGRATION OF WHITES

From March 1975 to March 1977, the Northeast and North Central regions had net outmigration of Whites. About 615,000 Whites 2 years old and over moved to the Northeast, but 1,101,000 left, giving the region a net outmigration of 483,000. Whites moving to the North Central region numbered about 1,066,000, compared with an outmigration of 1,443,000, leaving that region with a net outmigration of 377,000.

In contrast to the Northeast and North Central regions, the South and West had net immigration of Whites 2 years old and over between March 1975 and March 1977. The South's net gain was about 436,000 and that for the West was 424,000. These and other figures cited above exclude migrants to the United States from abroad.

In contrast to the changes in Black interregional migration, the regional migration of Whites from 1975 to 1977 basically reflects patterns established in the 1960's. The Northeast and North Central regions had net outmigration of Whites from 1975 to 1977 just as they did in the 1960's. The South and West had net immigration of Whites from 1975 to 1977, just as in 1960 to 1970.⁸

METROPOLITAN AND NONMETROPOLITAN MIGRATION

More persons moved from metropolitan areas than to them in the 2-year period from March 1975 to March 1977. Excluding movers from abroad, the number of movers from SMSA's exceeded the number of movers to SMSA's by 613,000. The central cities of SMSA's (as defined in 1970) had a net outmigration of 3,331,000 persons 2 years old and over from 1975 to 1977. The net immigration to the suburbs from 1975 to 1977 was 2,718,000 persons 2 years old and over.

The net outmigration experienced by SMSA's from 1975 to 1977 represents the continuation of a pattern observed earlier in this decade. It is a change from the 1960's, however, when the net outmigration experienced by many large cities was more than offset by the volume of net immigration to the suburbs.⁹

In the 1975-77 period, the 3,815,000 persons 2 years old and over moving out of SMSA's were equally likely to have come from the central cities as from the suburban balance of SMSA's. Among the 3,202,000 movers to SMSA's, those moving to the suburbs outnumbered those moving to the central cities by 2 to 1.

An important difference between Blacks and Whites in migration patterns concerns movement between metropolitan and nonmetropolitan areas. Between March 1975 and March 1977, metropolitan areas in the aggregate had net outmigration of Whites. Among Blacks, however, the data indicate that the number of Blacks moving to metropolitan areas approximately equaled the number moving from metropolitan areas. These comparisons exclude movers from abroad and refer to SMSA's as defined in 1970.

INTERVAL LENGTH

The mobility questions that are used in the CPS do not measure number of moves during a given time period but estimate the number of persons who lived in a different house at the beginning of the period than at the survey date. In other words, the number of movers is estimated, not the number of moves. Persons who moved more than once are counted only once; and persons who moved out of their current residence but returned by the end of the period are not counted as movers at all. As a result, a count of the number of movers in a shorter period more nearly approximates the number of moves during that period than is measured in a longer interval which more nearly measures the percentage of the population that is affected by mobility.

The effect of repeat movers on short-interval mobility rates can be illustrated by comparing the 1-year mobility rate from the March 1976 CPS with the 2-year rate derived from

⁹ U.S. Bureau of the Census, *Census of Population and Housing: 1970, PHC(2)-1, General Demographic Trends for Metropolitan Areas, 1960 to 1970, United States Summary.* Washington, D.C.: Government Printing Office, 1971.

data collected in the 1977 survey. According to estimates of the 1976 survey, 17.1 percent of the 208,069,330 persons 1 year old and over were living in a different house in the United States 1 year earlier. By comparison, the present survey shows 26.5 percent of the 206,419,000 persons 2 years old and over were living in a different house in the United States on that date 2 years earlier. If none of the persons who moved in the first year of the 2-year period also moved in the second year, then we would expect the 2-year mobility rate to be twice the 1-year rate or approximately 34.2 percent—7.7 percentage points more than actually found. Therefore, we can conclude that nearly half (45 percent) of the movers in a 2-year period are repeat movers.¹⁰

MIGRATION UNIVERSE

The mobility data in this report are derived from the answers to a series of questions on residence 2 years before the survey date and the geographic location of the respondent's current residence. A facsimile of the questions on previous residence is shown below. These questions were asked for all members of the survey household who were 14 years old and over on the survey date. Previous residence for persons under 14

years old was allocated based on the responses of their parents or other members of the household. (See the section on "Nonresponses and Allocations" for a further discussion of the allocation of mobility data for children and other persons for whom no response or only partial responses to the mobility questions were given.)

54. Was ... living in this house 2 years ago, that is, on March 1, 1975?	
Yes	No
(Skip to 57)	(Ask 55)
55. Where did ... live on March 1, 1975?	
a. Name of State, foreign country, U.S. possession, etc. _____	
b. Name of county _____	
56. Did ... live inside the limits of a city, town, village, etc.?	
Yes	No
Name of city, town, etc. _____	

The universe sampled includes all civilian noninstitutional households and households headed by members of the Armed Forces living off base or with their families on base. (For a more detailed discussion of the sample selection and limitations of the sample and survey design, see the appendix section on "Source and Reliability of the Estimates.")

¹⁰ A more complete analysis of the complex relationships between mobility rates derived from intervals of different lengths, entitled "A Comparison of Migration Measures of Different Intervals," can be obtained from John F. Long or Celia G. Boertlein, Population Division, U.S. Bureau of the Census, Washington, D.C. 20233.

NOTE

In the past the Census Bureau has designated a head of household to serve as the central reference person for the collection and tabulation of data for individual members of the household (or family). However, recent social changes have resulted in a trend toward recognition of more equal status for all members of the household (or family), making the term "head" less relevant in the analysis of household and family data. As a result, the Bureau is currently developing new techniques of enumeration and data presentation which will eliminate the concept of "head." While much of the data in this report are based on the concept of "head," methodology for future Census Bureau reports will reflect a gradual movement away from this traditional practice.

Appendix

RELATED REPORTS

Statistics on the mobility of the population have been collected annually in the Current Population Survey since 1938. Tables similar to those in this report were published for the 1975-76 period in Series P-20, No. 305, "Geographical Mobility: March 1975 to March 1976"; for the 1970-75 period in Series P-20, No. 285, "Mobility of the Population of the United States: March 1970 to March 1975," for the 1970-74 period in Series P-20, No. 273; and for the 1970-73 period in Series P-20, No. 262. Data for the 1970-71 period were issued in Series P-20, No. 235, and similar statistics were published in this series each year beginning with the report for 1947-48.

Statistics on geographic mobility of the population for cities, counties, SMSA's, urbanized areas, State economic areas, States, divisions, regions, and the United States appear in Volume I of the 1970 Census of Population (based on State of birth or residence 5 years before the census). Detailed statistics on mobility status by race and sex for these areas and the United States appear in Volume II, Subject Reports: PC(2)-2A, State of Birth; PC(2)-2B, Mobility for States and the Nation; PC(2)-2C, Mobility for Metropolitan Areas; PC(2)-2D, Lifetime and Recent Migration; PC(2)-2E, Migration Between State Economic Areas; and PC(2)-7E, Occupation and Residence in 1965. Some other subject reports of the 1970 census present statistics on mobility status in relation to the main subject of the report.

ALLOCATIONS OF MOBILITY STATUS

In the March 1977 CPS, complete mobility information was not reported for about 6 percent of all persons 14 years old and over and the mobility questions were not asked for any persons under 14 years of age. In these cases, missing mobility data are allocated by values obtained for other family members if available or from other active respondents with similar demographic characteristics. The previous residence assigned to a nonrespondent is that obtained for another person with similar demographic characteristics who did respond and who has been selected systematically in the order in which individual records are processed. Characteristics used in these allocations (when mobility data for other family members are not available) are age, race, years of school completed, metropolitan status, and State of current residence. (State of previous residence is used instead of State of current residence if State but not place or county of previous residence is provided by the respondent.)

DEFINITIONS

Population coverage. The population in this report includes the civilian population of the United States and members of the Armed Forces in the United States living off base or with their families on base, but excludes all other members of the Armed Forces. Inmates of institutions were not included in the survey.

Geographic regions. The four major regions of the United States for which data are presented in this report represent groups of States, as follows:

Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont;

North Central: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, Wisconsin;

South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, West Virginia;

West: Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, Wyoming.

Mobility status. The population 2 years old and over was classified according to mobility status on the basis of a comparison between the place of residence of each individual at the time of the March 1977 survey and the place of residence 2 years earlier. Nonmovers are all persons who were living in the same house at the end of the period as at the beginning of the period. Movers are all persons who were living in a different house at the end of the period than at the beginning. Movers are further classified as to whether they were living in the same county, State, or region; were movers from abroad; were living in the same or different central city or SMSA; or had made some other type of move.

Metropolitan residence. The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county or counties containing this "central city," contiguous counties are included in an SMSA if,

according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with central county. In New England, SMSA's consist of towns and cities, rather than counties. The metropolitan population in this report is based on SMSA's as defined in the 1970 census and does not include any subsequent additions or changes. The terms "nonmetropolitan" and "outside SMSA's" are synonymous. The "balance of the SMSA" refers to the remainder of the SMSA, outside the central city or cities, and is synonymous with the term "suburbs." The "size of the SMSA" refers to the number of persons living in the SMSA at the time of the 1970 census.

Age. This classification is based on the age of the person at his or her last birthday.

Race. The population is divided into three groups on the basis of race: White, Black, and other races. The last category includes Indians, Japanese, Chinese, and any other race except White and Black. In this report, other races are included in the totals but not shown separately.

Spanish origin. Persons of Spanish origin were determined on the basis of a question that asked for self-identification of the person's origin or descent. Respondents were asked to select their origin (or the origin of some other household member) from a "flash card" listing ethnic origins. Persons of Spanish origin, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Cuban, Central or South American, or some other Spanish origin. Persons of Spanish origin may be of any race.

Marital status. The marital status classification identifies four major categories: single, married, widowed, and divorced. These terms refer to the marital status at the time of the survey. Married persons are further divided into "married, spouse present" and "married, spouse absent." A person was classified as "married, spouse present" if the husband or wife was reported as a member of the household, even though he or she may have been temporarily residing elsewhere.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either direct access from the outside or through a common hall or a kitchen or cooking equipment for the exclusive use of the occupants. A household includes the related family members and all the unrelated persons, if any, who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, also count as a household. Persons living in rooming houses, college dormitories, or other group quarters are not included in the count as households.

Family status. The term "family" refers to a group of two or more persons related by blood, marriage, or adoption and residing together; all such persons are considered as members of the same family. Lodgers, foster children, wards, or employees and members of their families are not considered part of the head's family. A household may include more than one family. A primary family is a family that includes among its members the head of a household. A husband-wife family is a family with a head who is "married, spouse present."

Head of household, or family. One person in each household (and in each family) is designated as the "head." The number of heads, therefore, is equal to the number of households (or families). The head is usually the person regarded as the head by the members of the group. Married women are not classified as heads if their husbands are living in the same household at the time of the survey.

Primary individual. A primary individual is a household head living alone or with nonrelatives only.

Unrelated individuals. The term "unrelated individuals" refers to persons who are not living with any relatives. An unrelated individual may constitute a one-person household, may be part of a household including one or more other families or unrelated individuals, or may reside in group quarters such as a rooming house.

Own children. "Own children" in a family are sons and daughters, including stepchildren and adopted children, of the family head. The count of own children under 18 years old is limited to single (never married) children.

Years of school completed. Data on years of school completed were derived from the combination of answers to questions concerning the highest grade of school attended by the person and whether or not the grade was finished. The questions on educational attainment apply only to schooling that may advance a person toward an elementary school certificate or high school diploma, or a college, university, or professional school degree.

Labor force status. Persons are classified as "in the labor force" if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians classified as employed or unemployed. All civilians who are not classified as employed or unemployed are defined as "not in labor force." Employed persons include all civilians who did any work at all during the specified week as paid employees or in their own business or professional practice, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and all those who were not working but who had a job or business from which they were temporarily absent, whether or not they were paid by their employers for the time off,

and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work in or around their own house or volunteer work. Unemployed persons are those civilians who had no employment but were available for work and had engaged in any specific jobseeking activity within the last 4 weeks or were on a union or professional register, were waiting to be called back to a job from which they had been laid off, or were waiting to report to a new job within 30 days.

Occupation. The data on occupation of employed persons refer to the civilian job held during the survey week. Persons employed at two or more jobs were reported in the job at which they worked the greatest number of hours during the week. The occupation groupings used here are mainly the major groups used in the 1970 census. The composition of these groups is shown in the 1970 Census of Population, PC(1)-C Series, *General Social and Economic Characteristics*.

Income. For each person 14 years old and over, questions were asked on the amount of money income received in the preceding calendar year. The income of the family does not include amounts received by persons who were members of the family during all or part of the income year if these persons no longer resided with the family at the time of the survey. On the other hand, family income includes amounts reported by related persons who did not reside with the family during the income year but who were members of the family on the survey date.

Public assistance. Families are classified as "with public assistance" if one or more persons in the family received any public assistance or welfare payments in the preceding year. "Public assistance," as defined in this report, does not include Supplemental Security Income (SSI) payments.

Poverty status. Families and unrelated individuals are classified as being above or below the poverty level, using the poverty index adopted by a Federal Interagency Committee in 1969. This index provides a range of income cutoffs or "poverty thresholds" adjusted to take into account such factors as family size, sex and age of the family head, the number of children, and farm-nonfarm residence. These income cutoffs are updated every year to reflect the changes in the Consumer Price Index. The average poverty threshold for a nonfarm family of four was \$5,815 in 1976.

Mean. The mean (average) number of persons per family is the value obtained by dividing the number of persons having the characteristics under consideration by the appropriate number of families. The mean number of own children is the

number of own children of the age under consideration divided by the total number of families with own children.

Median. The median is the value which divides the distribution into two equal parts, one-half of the cases falling below this value and one-half of the cases exceeding this value. It is presented in connection with the data on age, years of school completed, and income.

Rounding. Detailed data in the tables may not agree with the totals because of independent rounding. Furthermore, calculations such as means, medians, and percentages are based on the unrounded figures and therefore may not agree with those derived from rounded figures in the table.

Symbols. A dash "-" represents zero or rounds to zero, and the symbol "B" means that the base is less than 75,000.

Source and Reliability of the Estimates

Source of data. Most of the estimates in this report are based on data collected by the Current Population Survey (CPS) conducted by the Bureau of the Census. Other information in the report are from journal articles and are footnoted in the text. The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked about each member 14 years old and over in every sample household. In addition, supplementary questions were asked in March 1977 about place of residence 2 years ago (March 1, 1975).

The present CPS sample was initially selected from the 1970 census files and is updated continuously to reflect new construction where possible (see section, "Nonsampling Variability," below). The monthly CPS sample is spread over 461 areas with coverage in each of the 50 States and the District of Columbia. For March 1977 a supplementary sample of housing units in 24 States and the District of Columbia was incorporated with the monthly CPS to produce mobility and income data. The expanded sample is located in 614 areas comprising 1,113 counties, independent cities, and divisions in the nation. The 614 sample areas used in March include 461 areas from the monthly CPS and 153 supplementary areas.

Samples for previous sample designs were selected from files from the most recently completed census. The following table provides a description of some aspects of the CPS sample designs in use during the referenced data collection periods.

Description of the Current Population Survey

Time period	Number of sample areas ¹	Households eligible		Households visited, not eligible ²
		Interviewed	Not interviewed	
August 1972 to present.....	461	45,000	2,000	8,000
Supplemental sample.....	153	8,500	500	1,500

¹These areas were chosen to provide coverage in each State and the District of Columbia with the exception of the supplementary sample.

²These are households which were visited, but were found to be vacant or otherwise not eligible for interview.

The estimation procedure used for the monthly CPS data involves the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from decennial censuses; statistics on births, deaths, immigration and emigration; and statistics on the strength of the Armed Forces. For the estimates in this report persons in the Armed Forces were also included. The estimation procedure for the data in the report also involved a further adjustment so that husband and wife of a household received the same weight.

Reliability of the estimates. Since the estimates in this report are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaires, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey—sampling and nonsampling. The standard errors provided for this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration but do not measure any systematic biases in the data. The full extent of nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

Nonsampling variability. As in any survey work, the results are subject to errors of response and nonreporting in addition to sampling variability. Nonsampling errors can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness to provide correct information on the part of respondents, inability to recall information, mistakes made in collection such as in recording or coding the data, mistakes made in processing the data, mistakes made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Overall undercoverage, as compared to the level of the decennial census, is about 5 percent. It is known that CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races than for Whites. Ratio estimation to independent age-sex-race population controls, as described previously, partially corrects for the bias due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics than interviewed persons in the same age-sex-race group. Further, the independent population controls used have not been adjusted for undercoverage in the 1970 census, which was estimated at 2.5 percent of the population with similar undercoverage differentials by age, sex, and race as is observed in CPS.

The approximate magnitude of two sources of undercoverage of housing units is known. Of the 83,000,000 housing units in the U.S., about 600,000 new construction housing units other than mobile homes are not represented in the CPS sample because they were assigned building permits prior to the 1970 census, but building was not completed by the time of the census (i.e., April 1970). Most conventional new construction, for which building permits were issued after the census, is represented. About 290,000 occupied mobile homes are not represented in CPS; these units were either missed in the census or have been built or occupied since the census. The extent of other sources of undercoverage of housing units is unknown but believed to be small. These estimates of missed units are relevant to the present sample only and not to earlier designs where the extent of undercoverage was generally less.

Sampling variability. The standard errors given in the following tables are primarily measures of sampling variability, that is, of the variations that occur by chance because a sample rather than the whole of the population is

surveyed. The chances are about 68 out of 100 that an estimate from the survey differs from a complete census figure by less than the standard error. The chances are about 90 out of 100 that this difference would be less than 1.6 times the standard error and about 95 out of 100 that the difference would be less than twice the standard error.

All statements of comparison appearing in the text are significant at a 1.6 standard error level or better, and most are significant at a level of more than 2.0 standard errors. This means that for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by the use of the phrase, "some evidence") have a level of significance between 1.6 and 2.0 standard

Comparability with other data. Caution should be used in comparing estimates of the supplemental sample and estimates using the national sample only. The use of the supplemental sample has resulted in some differences in estimates as compared to using the national sample only. However, most of the differences are within sampling error with the major exception being estimates of Black and other races by metropolitan and nonmetropolitan categories where there has been a decrease in metropolitan areas and an increase in nonmetropolitan areas.

Note when using small estimates. Summary measures (such as medians and percent distributions) are shown in the report only when the base of the percentage is 75,000 or greater. Because of the large standard errors involved, there is little chance that percentages would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's needs.

Standard error tables and their use. In order to derive standard errors that would be applicable to a large number of estimates and could be prepared at a moderate cost, a number of approximations were required. Therefore, instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result, the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error.

The figures presented in tables A-1 and A-2 are approximations to standard errors. Estimated standard errors for specific characteristics cannot be obtained from tables A-1 and A-2 without the use of the appropriate factors in table A-3. These factors must be applied to the generalized standard errors in order to adjust for the combined effect of sample design and estimating procedure on the value of the characteristic. Standard errors for intermediate values not shown in the generalized tables may be approximated by interpolation.

Two parameters (denoted "a" and "b") are used to calculate standard errors for each type of characteristic; they are presented in table A-4. These parameters were used to calculate the standard errors and factors in table A-1 through A-3. They also may be used to directly calculate the standard errors for estimated numbers and percentages. Direct computation of the standard errors will give more accurate results than the use of the standard error tables and the factors. Methods for direct computation are given in the following sections.

Standard errors of estimated numbers. The approximate standard error, σ_x , of an estimated number shown in this report can be obtained in two ways. It may be obtained by use of the formula

$$\sigma_x = f\sigma \quad (1)$$

where f is the appropriate factor from table A-3, and σ is the standard error on the estimate obtained by interpolation

Table A-1. Standard Errors of Estimated Numbers

(68 chances out of 100. Number in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
10.....	7	5,000.....	149
25.....	11	7,500.....	181
50.....	15	10,000.....	208
100.....	21	15,000.....	252
250.....	34	25,000.....	317
500.....	48	50,000.....	418
1,000.....	67	75,000.....	472
2,500.....	106	100,000.....	494
		150,000.....	457

from table A-1. Alternatively, standard errors may be approximated by the following formula, (2), from which the standard errors in table A-1 were calculated. Use of this formula will provide more accurate results than the use of formula (1) above.

$$\sigma_x = \sqrt{ax^2 + bx} \quad (2)$$

Here x is the size of the estimate and a and b are the parameters in table A-4 associated with the particular type of characteristic.

Standard errors of estimated percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends on both the size of the percentage and the size of the total upon which this percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameters indicated by the numerator. The approximate standard error, $\sigma_{(x,p)}$, of an estimated percentage can be obtained by use of the formula

$$\sigma_{(x,p)} = f\sigma \quad (3)$$

In this formula f is the appropriate factor from table A-3, and σ is the standard error on the estimate from table A-2. Alternatively, standard errors may be approximated by the following formula, (4), from which the standard errors in table A-2 were calculated; direct computation will give more accurate results than use of the standard error tables and the factors.

$$\sigma_{(x,p)} = \sqrt{\frac{b}{x} \cdot p(100-p)} \quad (4)$$

Here x is the size of the subclass of persons which is the base of the percentage, p is the percentage ($0 \leq p \leq 100$), and b is the parameter in table A-4 associated with the particular type of characteristic in the numerator of the percentage.

Illustration of the use of tables of standard errors. Table 1 of this report shows that 3,202,000 persons moved from outside SMSA's into SMSA's between March 1975 and March 1977. Table A-1 shows the standard error on an estimate of this size to be approximately 118,000. Applying the appropriate factor from table A-3 and using formula (1), the approximate standard error is $1.5 \times 118,000 = 177,000$. The chances are 68 out of 100 that the estimate would have been a figure differing from a complete census figure by less than 177,000. The chances are 95 out of 100 that the estimate would have differed from a complete census figure by less than 354,000 (twice the standard error). Alternatively, using formula (2) and the parameters $a = -0.000066$ and $b = 10,411$ from table A-4 gives an estimate of the standard error of 181,000.

Table 1 also shows that 6,794,000 Spanish origin persons were nonmovers between March 1975 and March 1977 of which 3,275,000, or 48.2 percent, were men. Since the numerator of this percentage is the nonmover men of Spanish origin, the b parameter from table A-4 is 4,432; using formula (4), the standard error on an estimate of 48.2 percent is

$$\sqrt{\frac{4,432}{6,794,000} \cdot 48.2(100-48.2)} = 1.3 \text{ percent}$$

Consequently, chances are 68 out of 100 that the estimated 48.2 percent would be within 1.3 percentage points of a complete census figure. Chances are 95 out of 100 that the

Table A-2. Standard Errors of Estimated Percentages

(68 chances out of 100)

Base of percentage (thousands)	Estimated percentage						
	2 or 98	5 or 95	10 or 90	20 or 80	25 or 75	35 or 65	50
75.....	3.4	5.4	7.4	9.8	10.7	11.7	12.3
100.....	3.0	4.6	6.4	8.5	9.2	10.2	10.6

1,000.....	0.9	1.5	2.0	2.7	2.9	3.2	3.4
2,500.....	0.6	0.9	1.3	1.7	1.8	2.0	2.1
5,000.....	0.4	0.7	0.9	1.2	1.3	1.4	1.5
10,000.....	0.3	0.5	0.6	0.9	0.9	1.0	1.1
25,000.....	0.2	0.3	0.4	0.5	0.6	0.6	0.7
50,000.....	0.13	0.2	0.3	0.4	0.4	0.5	0.5
100,000.....	0.09	0.15	0.2	0.3	0.3	0.3	0.3
150,000.....	0.07	0.12	0.2	0.2	0.2	0.3	0.3
200,000.....	0.06	0.10	0.14	0.2	0.2	0.2	0.2

estimate would be within 2.6 percentage points of a complete census figure, i.e., the 95-percent confidence interval would be from 45.6 to 50.8 percent. As an alternative, tables A-2 and A-3 can be used to get an estimated standard error of $1.0 \times 1.3 = 1.3$ percent on the estimate of 48.2 percent.

Standard error of a difference. For a difference between two sample estimates, the standard error is approximately equal to

$$\sigma_{(x-y)} \doteq \sqrt{\frac{\sigma_x^2}{x} + \frac{\sigma_y^2}{y}} \quad (5)$$

where σ_x and σ_y are the standard errors of the estimates x and y ; the estimates can be of numbers, percents, averages, etc. This will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics the formula will overestimate the true standard error.

Illustration of the computation of the standard error of a difference between estimated numbers. Table 1 of the report shows that between March 1975 and March 1977, 3,815,000 persons moved from SMSA's to outside SMSA's. Thus the apparent difference between the number of persons moving into and out of SMSA's is 613,000. The standard error (σ_x) of 3,202,000 movers is 177,000, as shown above. Table A-1 and factor table A-3 show the standard error (σ_y) of 3,815,000 to be approximately 193,000. Therefore, using formula (5), the standard error of the estimated difference of 613,000 is about

$$262,000 \doteq \sqrt{(177,000)^2 + (193,000)^2}$$

This means the chances are 68 out of 100 that the estimated difference based on the sample estimates would vary from the difference derived using complete census figures by less than 262,000. The 68-percent confidence interval about the 613,000 difference is from 351,000 to 875,000, i.e., $613,000 \pm 262,000$. A conclusion that the average estimate of the difference derived from all possible samples of the same size and design lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. The 95-percent confidence interval is from 89,000 to 1,137,000. Thus, we can conclude with 95-percent confidence that there is a difference between the persons moving into and out of SMSA's between March 1975 and March 1977.

Standard error of a ratio. All mean values for persons in families shown in the tables of this report were calculated as the ratio of two numbers. For example, the mean number of own children under 18 is calculated by

$$\frac{x}{y} = \frac{\text{total number of own children under 18}}{\text{total number of family heads with own children}}$$

The denominator, y , of the ratio always represents a count of family heads of a certain class. The numerator, x , represents a count of persons with the characteristics under consideration who are members of these families; this count may be 0, 1, 2, 3 or more. Standard errors for these means may be approximated using the following formula:

$$\sigma\left(\frac{x}{y}\right) = \sqrt{\left(\frac{x}{y}\right)^2 \left[\left(\frac{\sigma_y}{y}\right)^2 + \left(\frac{\sigma_x}{x}\right)^2 \right]} \quad (6)$$

The standard error of the estimated number of family heads, σ_y , and the standard error of the estimated number of persons with the characteristic in those families, σ_x , may be calculated by methods described above.

Standard error of estimated medians. The sampling variability of an estimated median depends upon the form of the distribution as well as on the size of its base. An approximate method for measuring the reliability of a median is to determine an interval about the estimated median, such that there is a stated degree of confidence that the median based on a complete census lies within the interval. The following procedure may be used to estimate the 68-percent confidence limits of a median based on sample data.

1. Determine, using formula (3) or formula (4) and the appropriate base, the standard error on a 50-percent characteristic.
2. Add to and subtract from 50 percent the standard error determined in step 1.
3. Using the distribution of the characteristic, calculate the confidence interval corresponding to the two points established in step 2.

A two-standard-error confidence interval may be determined by finding the values corresponding to 50 percent plus and minus twice the standard error determined in step 1.

Illustration of the computation of a confidence interval for a median. Table 6 of this report shows that the median age of persons moving to a different State between March 1975 and March 1977 was 25.1 years. The base of the distribution from which the median was determined is 9,946,000 persons.

X Not applicable.

1. Table A-2 and factor table A-3 show that the standard error of 50 percent on a base of 9,946,000 is about 1.1 percent.
2. To obtain a 95-percent confidence interval on the estimated median, add to and subtract from 50 percent twice the standard error found in step 1. This yields percentage limits of 47.8 and 52.2.
3. From table 6 it can be seen that 30.7 percent of all movers were younger than 20 years old, 19.1 percent of the movers were in the 20-to-24 year old age group, and 16.2 percent were 25 to 29 years

old. By linear interpolation, the lower limit of the estimate is found to be about:

$$20.0 + (25.0 - 20.0) \left(\frac{47.8 - 30.7}{19.1} \right) = 24.5$$

Similarly, the upper limit may be found by linear interpolation to be about:

$$25.0 + (30.0 - 25.0) \left(\frac{52.2 - 49.8}{16.2} \right) = 25.7$$

Hence, the 95-percent confidence interval about the estimated median is 24.5 to 25.7 years of age.
